Climate Vulnerability and Adaptation Assessment of Cambodian Secondary Cities Project

The project assessed the nature and spatial location of climate hazards, vulnerabilities, and risks in four Cambodian cities, given current climate change projections and adaptive capacities. The project was implemented in the four cities Battambang, Kampot, Kratie and Chhlong where a climate vulnerability and adaptation assessment was performed. Based on the assessments, the project proposed climate resilient investment packages. The proposed adaptation

options fed into the feasibility study which was implemented in parallel. All work was undertaken to improve the resilience of the cities' infrastructure and to strengthen their ability to manage disruption from climate change related and other natural hazards with a gender focus.

Master Plans proposals based on climate strategies was developed for all four Cities.

Master Plans proposals based on climate strategies was developed for Kampot.
