PROJECT PERIOD

2015-16

CONSULTING SERVICE

- Infrastructure
- Microsimulation model
- Masterplan

In association with COWI

The project was aimed to alleviate transport problems in the city of Kampala by improving the infrastructure in downtown

TRANSPORT PLAN

For Kampala city centre aims to strengthen the city so that it can continue to accommodate the large volume of traffic. The purpose is to organize the traffic and create better conditions for pedestrians, cyclists and urban life in general. The project was aimed to alleviate transport problems in the city of Kampala by improving downtown as a public transport hub and focal point for retail and leisure uses. The urban location and the many uses of the area create unique opportunities

for transformation to enhance the entire city, the area and the infrastructure and strengthen downtown as a public transport hub. It is more or less already a focal point for retail and leisure uses, but it has to be transformed in regards to good sustainable solutions and consideration of accessibility and urban life which can improve a greater reliance on public transport, cycling and walking. A successful transformation requires a good overall vision that helps implement the different desires and expectations of the transformation.
