CONSULTAN SERVICES

- Development of the concept and final design of the fountain
- Supply/tender
- Supervision

Role and partners

Landscape architect
Partner, Fokdal Springvand

Design of the fountain for Peder Niensens Plads in Brønderslev

Design of the fountain

Development of the concept and programming of the square's fountain. Conceptual design and the final design of the fountain. The water radiates from 5 corten steel lines and the water jets are illuminated from underneath. The jets reach up to about 2 meters. In the center there are 3 areas that have been built with fog nozzles illustrating "the bog woman brew", which is a famous part of the area's surrounding landscape. Variable programs for intensity. Technical installations: buried technical well and water well. Rainwater recirculates. Visible materials: waterlines in cortensteel, galvanised steel, cast-in-place concrete, and stainless steel.
